## 1.1 Project Overview

This micro project imports structured data from an external spreadsheet into the ServiceNow platform using **Import Sets** and **Transform Maps**. It simulates a real-world scenario in which bulk employee data (Employee ID, Employee Name, Email, Department and Location) is received in Excel format and must be migrated into ServiceNow efficiently and accurately.

The spreadsheet is first loaded into an **Import Set table** (Employee Import, u\_employee\_import) that acts as a temporary staging area. A **Transform Map** (Sample Spreadsheet Import) then maps the source fields to the target table **Employee Test** (u\_employee\_test). When the transform runs, records are created in the target table and validated to ensure data integrity.

The project was extended in three ways: **Coalesce** on Employee ID prevents duplicate records when the same data is imported repeatedly; **Transform History** is used to verify how many rows were inserted, updated or ignored; and three **Reports** combined on the **Employee Analytics Dashboards** give HR teams a visual summary of the data.

## 1.2 Purpose

The purpose of the project is to help beginners understand the end-to-end data import process in ServiceNow:

- **Data loading** – uploading a spreadsheet into a staging (import set) table with Load Data.
- **Field mapping** – defining how source columns map to target fields with a Transform Map and Auto Map Matching Fields.
- **Transformation execution** – running the transform and checking the success message and Transform History.
- **Duplicate prevention** – using Coalesce on a unique key (Employee ID) so existing records are updated and new ones inserted.
- **Result verification and reporting** – validating records in the target table and presenting them in reports and a dashboard.

## 1.3 Scope of the Project

| Area        | Included                                                                                                                       |
|-------------|--------------------------------------------------------------------------------------------------------------------------------|
| Spreadsheet | Sample employee data created in Google Sheets and downloaded as Sample Spreadsheet.xlsx                                        |
| Tables      | Custom target table Employee Test (u_employee_test) with five String fields; staging table Employee Import (u_employee_import) |

| Area                | Included                                                                                                                   |
|---------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>Import</b>       | Load Data (Sheet number 1, Header row 1), Transform Map Sample Spreadsheet Import, Auto Map Matching Fields, Run Transform |
| <b>Data quality</b> | Validation of Employee ID, Name and Email; Coalesce on Employee ID; Transform History review                               |
| <b>Insight</b>      | Reports (Employees by Department, Employees by Location, Employee List) and Employee Analytics Dashboards                  |
| <b>Out of scope</b> | Scheduled/automated data sources, REST integrations and custom scripts (listed under Future Scope)                         |

## 1.4 System Requirements

- ServiceNow Personal Developer Instance (PDI) or a ServiceNow instance with development access.
- Application development / customization access (administrator role).
- Import Sets functionality enabled.
- Transform Maps functionality available.
- Google Sheets (to author data) and Microsoft Excel format (.xlsx) for the upload file.

## 1.5 Source Data Fields

The administrator uploads a spreadsheet containing the following fields. Each becomes a String field in both the staging table and the target table.

| Field (Column Label) | Type   | Purpose                                                   |
|----------------------|--------|-----------------------------------------------------------|
| <b>Employee ID</b>   | String | Unique key of the employee – used as the Coalesce field   |
| <b>Employee Name</b> | String | Full name of the employee                                 |
| <b>Email</b>         | String | Employee e-mail address                                   |
| <b>Department</b>    | String | Department used for the “Employees by Department” report  |
| <b>Location</b>      | String | Work location used for the “Employees by Location” report |

## 1.6 Team Members and Roles

Work was shared among four team members. The roles below are the team’s proposed split of responsibilities.

| Team Member           | Role                             | Main responsibilities                                                                       |
|-----------------------|----------------------------------|---------------------------------------------------------------------------------------------|
| <b>Prasanna K</b>     | Team Lead / ServiceNow Developer | Custom table and form layout, Coalesce configuration, dashboard creation and ACL change     |
| <b>Yousuf Riyas S</b> | Data & Reporting Analyst         | Spreadsheet preparation, verification of target data, reports on Employee Test              |
| <b>Ratnakar K S</b>   | Import & Transform Specialist    | Load Data, Employee Import staging table, Transform Map and field maps, coalesce re-imports |

| Team Member        | Role                    | Main responsibilities                                                                      |
|--------------------|-------------------------|--------------------------------------------------------------------------------------------|
| Mohammed Thoufiq I | QA & Documentation Lead | Validation, duplicate-prevention testing, dashboard sharing, UAT and project documentation |
