Project Name	Import Data using Transform Maps (Spreadsheet)
Team Members	Prasanna K, Yousuf Riyas S, Ratnakar K S, Mohammed Thoufiq I

9. Conclusion

This project successfully implemented an automated employee data management solution using ServiceNow Import Sets and Transform Maps, ensuring accuracy, efficiency and data integrity throughout the employee onboarding and update process.

A key enhancement was the use of **Coalesce** on the Employee ID field map. The system identifies existing employee records during every import, so repeated imports update existing data instead of inserting redundant entries. In the test, an updated 4-row sheet produced **2 inserts and 2 updates**, and re-importing the same sheet produced **4 ignored rows and no duplicates**. As a result the employee table stays clean, reliable and consistent – which matters in real enterprise environments where data may be imported many times from external systems.

The project was also extended with **Reports and Dashboards** to give visibility into the employee data. Three reports – Employees by Department, Employees by Location and Employee List – were consolidated on the **Employee Analytics Dashboards**, so administrators and HR teams can monitor employee data trends and data quality from one place and rely less on manual analysis.

Key learnings

- How to prepare a spreadsheet and create a custom table with Form Layout.
- How Load Data creates an Import Set (staging) table and a Transform Map.
- How Auto Map Matching Fields and field maps move data into the target table.
- How Coalesce changes the behaviour of repeated imports, and how Transform History proves it.
- How to build reports and a dashboard, including the Admin Overrides ACL step for the dashboard form.

The work was completed by the four-member team – Prasanna K, Yousuf Riyas S, Ratnakar K S, Mohammed Thoufiq I – across four planned sprints.
